ALCOHOL AND THE SUSTAINABLE DEVELOPMENT GOALS

Major obstacle to development
Evidence shows that alcohol is a cross-cutting, harmful factor in many areas of the 2030 Agenda, such as:

- No poverty
- Zero Hunger
- Good health and well-being
- Quality education
- Gender equality
- Clean water and water security
- Decent work and economic productivity
- Reduced inequalities
- Sustainable cities and communities
- Responsible consumption and production
- Climate action
- Peace and justice
- Partnerships free from conflicts of interest

The 2030 Agenda contains 17 Sustainable Development Goals with 169 targets. The 17 SDGs cover all three aspects of sustainable human development: the social, environmental and economic dimension.

Alcohol is a major obstacle to sustainable human development, adversely affecting all three dimensions of sustainable development.

Alcohol kills 3.3 million people worldwide every year. It means: Every 10 seconds a human being dies because of alcohol. This represents 5.9% of all deaths. Globally, alcohol is the 5th leading risk factor for premature death and disability; among people between the ages of 15 and 49, it is the number one risk factor. Through its multiple public health, social and economic impacts, alcohol is a massive obstacle to achieving 13 out of 17 SDGs, and a total of 52 targets.

Alcohol is specifically mentioned in SDG 3 on health and well-being. Target 3.5 reads: “Strengthen the prevention and treatment of substance abuse, including narcotic drug abuse and harmful use of alcohol”
Vicious cycle of alcohol & poverty

SDG 1.1: By 2030, eradicate extreme poverty for all people everywhere, currently measured as people living on less than $1.25 a day

Alcohol has various adverse effects on people’s economic status while economic status in turn affects alcohol use in many ways.

Alcohol can push people into poverty and lock them, their families and entire communities there over generations. The direct costs of alcohol harm to the household are often considerable and frequently underestimated – and put a big burden on development.

- Latin America: alcohol has become the leading cause of male death and disability threatening further progress and sustainable development¹

- A study in Sri Lanka found that over 10% of male respondents reported spending as much as or more than their regular income on alcohol²
Vicious cycle of deprivation, alcohol, hunger

In low- and middle-income countries (LMICs), alcohol tends to crowd out other more productive household spending, such as spending on education, health care and healthy food. Both recognized and unrecognized alcohol expenditures have highly damaging impact on the most deprived families and communities. Desperately needed resources are being taken away from the little available for food and other basics. People with lower socio-economic status are more exposed and more vulnerable to tangible problems and negative consequences of alcohol use. This vulnerability is often passed on through generations. Thus, alcohol harm often contributes to the vicious cycle of deprivation, vulnerability and hunger.

- Socio-economically exposed people are less able to avoid adverse consequences of their behavior due to a lack of resources.
- People in poor and vulnerable communities have less extensive support networks, i.e., fewer factors or persons to motivate them to address alcohol problems.

SDG 2.1: By 2030, end hunger and ensure access by all people, in particular the poor and people in vulnerable situations.
ENSURE HEALTHY LIVES AND PROMOTE WELL-BEING FOR ALL AT ALL AGES

SDG 3.1: By 2030, reduce the global maternal mortality ratio...
SDG 3.2: By 2030, end preventable deaths of newborns and children under five...

Alcohol use during pregnancy risks mother’s and newborn’s survival, health

There is an urgent need to improve the health of pregnant women and their infants by identifying factors that place them at greater risk and providing interventions to improve their outcomes.

• Maternal alcohol use is associated with higher mortality rates for pregnant women and infants\(^5\)

• Alcohol use during pregnancy is associated with increased morbidity and mortality in infants and children\(^5\)

• Evidence from Ghana shows that alcohol consumption is significantly associated with abortion-related maternal deaths. Women who had ever consumed alcohol, frequent alcohol users, and even occasional alcohol users were about three times as likely to die from abortion-related causes compared to those who abstained from alcohol. Maternal age, marital status and educational level are factors that have a confounding effect on the observed association\(^6\)
ENSURE HEALTHY LIVES AND PROMOTE WELL-BEING FOR ALL AT ALL AGES

SDG 3.3: By 2030, end the epidemics of AIDS, tuberculosis, malaria and neglected tropical diseases and combat hepatitis, water-borne diseases and other communicable diseases

Alcohol major risk factor for TB, HIV/AIDS

Alcohol is widely established as a structural driver of both the TB and HIV/AIDS epidemics.

- There is a causal relationship between alcohol use and incidence of infectious diseases such as tuberculosis.

Causal relationships exist between:

- Alcohol consumption and HIV incidences
- Alcohol consumption on HIV/AIDS patients’ adherence to antiretroviral treatment
- Alcohol use and HIV/AIDS disease progression among patients who are not yet on antiretroviral therapy
SDG 3.4: By 2030, reduce by one third premature mortality from non-communicable diseases through prevention and treatment and promote mental health and well-being

Alcohol is one of four major risk factors for non-communicable diseases (NCDs). There is a causal relationship between alcohol use and a range of mental and behavioral disorders, such as cancer, cardiovascular disease, diabetes, as well as injuries.

- In the UK studies found that adolescents admitted to hospital with alcohol-related injuries face a five-times increased risk of committing suicide.

- In 1988 the International Agency for Research on Cancer (IARC) established: "Alcoholic beverages are carcinogenic to humans."

- In 2010 alcohol-attributable cancer was responsible for 4.2% of all cancer deaths and caused approximately 8.5 million potential years of life lost worldwide.

- Alcohol use has also been found to increase the risk of atrial fibrillation, heart attack, and congestive heart failure.
ENSURE HEALTHY LIVES AND PROMOTE WELL-BEING FOR ALL AT ALL AGES

SDG 3.5: Strengthen the prevention and treatment of substance abuse, including narcotic drug abuse and harmful use of alcohol

Alcohol & global death, disability

As a causal factor in more than 200 disease and injury conditions, alcohol is a significant and increasing risk factor for the global burden of morbidity and mortality.

- Overall 5.1% of the global burden of disease and injury is attributable to alcohol, as measured in disability-adjusted life years (DALYs)\(^\text{13}\)

- Alcohol consumption causes death and disability early in life – relative to other health hazards, and is thus a tremendous burden on young people: In the age group 20 to 39 years of age about 25% of the total deaths are alcohol-attributable\(^\text{14}\)

- Globally, alcohol consumption is the fifth leading risk factor for premature death and disability; among people between the ages of 15 and 49, it is the first\(^\text{15}\)
ENSURE HEALTHY LIVES AND PROMOTE WELL-BEING FOR ALL AT ALL AGES

SDG 3.6: By 2020, halve the number of global deaths and injuries from road traffic accidents

Alcohol & road traffic injuries, fatalities

Impairment by alcohol is an important factor influencing both the risk of an accident and the severity of the injuries that result from crashes. Driving under the influence of alcohol is a major risk factor for road traffic injuries, one of the leading causes of death among young people globally.

- 1 of 4 road fatalities in the EU is alcohol related. In 2010 nearly 31,000 Europeans were killed on the roads of which 25% of deaths were related to alcohol\(^6\)

- Studies in low-income countries have shown alcohol to be present in between 33% and 69% of fatally injured drivers\(^7\)

- In South Africa, alcohol was found to contribute to 61% of fatalities among pedestrians\(^8\)
ENSURE INCLUSIVE AND EQUITABLE QUALITY EDUCATION

SDG 4.1: By 2030, ensure that all girls and boys complete free, equitable and quality primary and secondary education leading to relevant and effective learning outcomes

Bottles over books: alcohol and children’s primary education

In many deprived and vulnerable communities children bear a disproportionate burden. Alcohol does play a tremendous role.

E.g., the impact of alcohol abuse and dependence on the user and the family:

- Parental roles are neglected and too often abandoned;
- Wages are wasted on alcohol, the household economy is ruined, jobs are lost;
- Resulting health issues even exacerbate the dire situation.

All that means scarce resources cannot be invested in children’s primary education and school material, depriving children of their right to primary education.19
SDG 5.1: End all forms of discrimination against all women and girls everywhere

The alcohol industry has amassed a vast case library of alcohol ads, commercials and other alcohol brand promotions that perpetuate discriminatory images and attitudes to women and girls.

The portrayal of women and girls in alcohol marketing fuels sexualization, objectification and de-humanization of women. It amplifies the common belief of masculine superiority over females and it justifies male demonstration of power over the other gender.

1. Environments (alcohol licensed venues) that incite narratives of loss of control and hyper-sexuality compromise the ability to counter sexual offending.

2. Presence of sexually violent advertising within alcohol licensed spaces undermines considerably the call to end gendered violence.
SDG 5.2: Eliminate all forms of violence against all women and girls in the public and private spheres, including trafficking and sexual and other types of exploitation

Alcohol fuels epidemic of violence against women

There is a strong relationship between alcohol and domestic abuse, intimate partner violence and sexual assault.

- Australia: Alcohol contributes to 50% of all partner violence, and to 73% of physical assaults by a partner\(^25\)

  Alcohol is seldom the sole explanation for the use of violence, but it’s often the triggering factor. Alcohol use creates a context for violent acts. It is often used as excuse for otherwise socially unacceptable behavior.\(^22\)

- 65% of women experiencing intimate partner violence in South Africa reported the perpetrator had used alcohol\(^23\)

- USA: victims of physical assault reported alcohol use by their partner in 55% of the cases\(^23\)

- Focus groups in rural Rwanda show that women who are victims of domestic violence rank alcohol as number one factor\(^24\)
ENSURE AVAILABILITY AND SUSTAINABLE MANAGEMENT OF WATER AND SANITATION FOR ALL

SDG 6.1: By 2030, achieve universal and equitable access to safe and affordable drinking water for all

SDG 6.4: By 2030, substantially increase water-use efficiency across all sectors and ensure sustainable withdrawals and supply of freshwater to address water scarcity and substantially reduce the number of people suffering from water scarcity

Drinking water or producing alcohol?

Over 40% of all people without improved drinking water live in sub-Saharan Africa.

In 2011, 768 million people remained without access to an improved source of drinking water. 70% of the world’s water resources are used for agriculture and irrigation, according to the Food and Agriculture Organization of the United Nations.26

Alcohol production is a threat to water security in many regions of the world:

- The water footprint of wine is horrible. To get one liter of wine, 870 liters of water are needed27
- The water footprint of beer is horrific. Per one liter of beer, 298 liters of water have to be used28

The effects on poor communities are most severe, when scarce resources are drained for the production of alcohol instead of sustaining community life and development.
SDG 8.2: Achieve higher levels of economic productivity through diversification, technological upgrading and innovation, including through a focus on high-value added and labor-intensive sectors

Massive economic costs due to alcohol

The economic burden of alcohol worldwide is substantial, accounting for up to 5.44% of Growth Domestic Product (GDP) in some countries. Costs of alcohol harm have been measured in different regions and are of massive scale:

- European Union: €156 billion yearly
- United States: $233.5 billion yearly
- South Africa: Combined tangible and intangible costs of alcohol harm to the economy reached nearly ZAR300 billion or 10–12% of GDP
SDG 8.8: Protect labor rights and promote safe and secure working environments for all workers, including migrant workers, in particular women migrants, and those in precarious employment

Alcohol workplace harm and lost productivity

Globally, alcohol is the world’s number one risk factor for ill-health and premature death amongst the 25 to 59 year-olds, the core of the working age population when people are typically at their most productive economically.\textsuperscript{33}

Alcohol use disorders likely result in billions of dollars of lost wages each year.\textsuperscript{34}

Alcohol is a significant risk factor for absenteeism and presenteeism at work, largely in a dose response manner, with a relationship between societal and individual level of alcohol consumption and sickness absence.\textsuperscript{35}

- 37\% of workers in Great Britain admit going to work with a hangover that has affected their productivity in the past year\textsuperscript{36}

- 35\% of the 1,300 construction workers surveyed had worked alongside people under the influence of alcohol\textsuperscript{36}
Leaving no youth in NEET behind

In 2013, over 14% of 16 to 24 year-olds in England (almost 900,000 youth) were not in employment, education or training (NEET).\textsuperscript{37}

The concept of NEET carries potential to address a broad array of vulnerabilities among youth, including issues of unemployment, early school leaving and labor market discouragement.

- Early alcohol abuse is a well documented risk factor for young people leaving school early and without qualifications\textsuperscript{38}

SDG 8.6: By 2020, substantially reduce the proportion of youth not in employment, education or training
Inequalities in alcohol-related harm exist based on factors including economic status, education, gender, ethnicity and place of residence. In general, lower socioeconomic groups consume less alcohol overall and are more likely to be abstainers, but they experience higher levels of alcohol-related harm than wealthier groups with the same level of consumption.39

Experiencing multiple aspects of socioeconomic disadvantage amplifies inequalities in alcohol-related harm.

- In the UK, health inequalities are estimated to cost £32-33 billion per year40

- In Sweden, manual workers are 2–3 times more likely to experience alcohol-related harm than civil servants, even when alcohol consumption levels were similar41
REDUCE INEQUALITIES IN AND AMONG COUNTRIES

SDG 10.3: Ensure equal opportunity and reduce inequalities of outcome

Alcohol’s harm to others

Alcohol use can have a range of negative consequences on people other than the alcohol consumer, for example physical violence, road traffic accidents, relationship problems, financial difficulties, feeling scared in public places, or reporting negative impacts on children due to parents’ alcohol use.

- 65% of women experiencing intimate partner violence in South Africa reported the perpetrator had used alcohol\(^{42}\)

- In rural Mexico, a $20 dollar long-lasting increase in the wife’s income is associated with a 15% decrease of the husband’s alcohol use and a 21% decrease of aggressive behavior\(^ {43}\)

- In the United States, more than 10% of children live with a parent with alcohol problems\(^ {44}\)

- In the EU, 9 million children grow up with parents who have alcohol problems\(^ {45}\)

- Almost \(\frac{3}{4}\) of adults in Australia (10 million people) are adversely affected by someone else’s alcohol use\(^ {46}\)
SDG 11.7: By 2030, provide universal access to safe, inclusive and accessible, green and public spaces, in particular for women and children, older persons and persons with disabilities.

Alcohol outlet density: unsafe public space, neighborhood violence

Safe public space is a Women’s Rights issue. Evidence shows that alcohol threatens women’s safety and freedom in public space, around pubs and clubs.

- New Zealand: more than 1 in 10 women ages 14 to 19 reported physical assaulted; 1 in 5 women ages 14 to 19 had been sexually harassed in the previous 12 months, by someone who had been using alcohol.¹⁴⁸

- England, Wales: Half of all incidents of alcohol-related violence occur in or around pubs and clubs.¹⁴⁹

In and near neighborhoods with a high density of alcohol outlets, there is a higher rate of violence. It means, when bars, liquor stores, and other businesses that sell alcohol are close together, more assaults and other violent crimes occur.
### SDG 11.7: By 2030, provide universal access to safe, inclusive and accessible, green and public spaces, in particular for women and children, older persons and persons with disabilities

---

**Alcohol – barrier to inclusive, enabling public space for children, adolescents, youth**

Inclusive public space is a youth rights issue. Evidence shows that alcohol-related exclusion from public space puts a heavy burden on adolescent’s health and well-being.

- **Sweden:** 21% of adolescents say they only use alcohol because there is nothing else to do during leisure time.\(^{50}\)

- **Sweden:** 87% of adolescents agree/partially agree that alcohol makes public space unsafe.\(^{50}\)

- **55%** of adolescents in Sweden say that they stay away from public space because of alcohol.\(^{50}\)

- High density of alcohol outlets is associated with increased binge consumption and a range of alcohol harms, such as violence, road traffic injuries or sexually transmitted infections.\(^{51}\)
SDG 12.2: By 2030, achieve the sustainable management and efficient use of natural resources

Alcohol production threatens sustainable use of natural resources

Droughts are expected to keep getting longer and more severe, increasingly affecting high-income as well as middle- and low-income countries. Water shortages are likely to become increasingly common as the world faces climate change and a growing population.

Alcohol production is jeopardizing natural resources, especially water, and is causing water shortages:

- The water footprint of wine is horrible. To get one liter of wine, 870 litters of water are needed\(^{27}\)

- The water footprint of beer is horrific. Per one liter of beer, 298 liters of water have to be used\(^{28}\)
SDG 12.3: By 2030, halve per capita global food waste at the retail and consumer levels and reduce food losses along production and supply chains, including post-harvest losses.

SDG 12.8: By 2030, ensure that people everywhere have the relevant information and awareness for sustainable development and lifestyles in harmony with nature.

What could be food becomes toxic, addictive, carcinogenic substance

Different types of starchy plants have been used for producing beer, including maize (South America), soy (India), millet and sorghum (Africa) and rice (Asia). Nowadays, beer production using barley malt is the most common brewing process worldwide. Processing barley into malt is an energy-consuming process.footnote{footnote52}

- In 2011, the global beer production amounted to about 1.93 billion hectoliters, up from 1.3 billion hectoliters in 1998. By some estimates, up to 92% of brewing ingredients are wastedfootnote{footnote53}

- Data shows that only 47% of consumers in the UK, or in the US only 39% of consumers are aware that alcohol causes 7 types of cancerfootnote{footnote54 footnote55}

Levels of alcohol harm (see above), alcohol's harm to others and the economic and social costs of alcohol make consumption levels unsustainable. Additionally, the negative impact on water security and food waste and even the energy-consuming production processes are causing externalities that are unsustainable.
Not green after all: Alcohol fuels greenhouse gas emissions, global warming

Very few people actually think of alcohol in terms of its climate impact. For achieving the goals of the 2030 Agenda, such a mindset needs to be challenged.

SDG 13.2: Integrate climate change measures into national policies, strategies and planning

- The contribution made by the alcohol consumed in the UK accounts for 1.46% of the UK’s total greenhouse gas emissions. The share of beer in alcohol’s total emissions amounts to 65%.

- In a lifecycle analysis of a Spanish beer, production and transport of raw materials used in beer production was found to contribute over one third of the total global environmental impact of the beer production lifecycle.

Other aspect of the alcohol industry contributing to global warming, greenhouse gas emissions, high energy use, pollution and use of natural resources are: refrigeration in the hospitality sector, use of fertilizers, water use, packaging, waste, transport of raw material and distribution of the products.
Pervasive alcohol violence

Alcohol violence impacts physical, mental and sexual health. It considerably burdens the public health system and other public sectors, making it a major sustainable development issue.

Globally, across all age groups, alcohol is estimated to be responsible for 26% and 16% of years of life lost through homicide by males and females respectively.59

- Across all industrialized countries, alcohol is estimated to be responsible for 41% of male and 32% of female DALYs lost through homicide60
- In Norway, 53% of victims of assaults presenting at an emergency department reported that their attacker had used alcohol prior to the attack60
- USA: up to 86% of homicide offenders, 37% of assault offenders, 60% of sexual offenders were under the influence of alcohol62
- England, Wales: Alcohol is involved in ca. 1.2 million violent incidents – almost half of all violent crimes63

SDG 16.1: Significantly reduce all forms of violence and related death rates everywhere
Youth: suffering from violence

Children, adolescents and youth bear a disproportionate burden of alcohol’s harm to others: they suffer alcohol violence perpetrated by adults, often parents.

SDG 16.2: End abuse, exploitation, trafficking and all forms of violence against and torture of children

- USA: 13% of child abusers are under the influence of alcohol\textsuperscript{64}
- Europe: 16% of all cases of child abuse and neglect are alcohol-related\textsuperscript{65}

The impact of youth violence reaches all sectors of society, placing huge strains on public services and damaging communities.

- Philippines: 14% of 15 – 24 year olds reported physically hurting someone through violence in the previous three months. This violence was significantly associated with alcohol\textsuperscript{66}
- Among 10 to 18 year-olds participating in the Caribbean Youth Health Survey, having used alcohol in the past year was significantly linked to weapon-related violence\textsuperscript{67}
Strengthen domestic resource mobilization, including through international support to developing countries, to improve domestic capacity for tax and other revenue collection.

**Alcohol taxation: win-win measure for financing development**

Independent science shows that employing evidence-based alcohol taxation measures reaps benefits across 10 out of 17 SDGs.\(^6^8\)

There is strong evidence that raising alcohol taxes is an effective strategy for reducing alcohol consumption and related harms.\(^6^9\)

Alcohol taxation is a powerful tool with a double positive effect:

- It reduces the burden of alcohol as obstacle to development.
- It helps raise funds for government welfare policy measures.
STRENGTHEN THE MEANS OF IMPLEMENTATION AND REVITALIZE THE GLOBAL PARTNERSHIP FOR SUSTAINABLE DEVELOPMENT

**SDG 17.3:** Mobilize additional financial resources for developing countries from multiple sources

**SDG 17.17:** Encourage and promote effective public, public-private and civil society partnerships, building on the experience and resourcing strategies of partnerships

**Big Alcohol: No partner for sustainable development**

Harmful business practices are taken out of the playbook of Big Tobacco:

- Tax schemes by multinational alcohol corporations are exploiting countries, especially in the global south.
- Aggressive lobbying seeks to block the implementation of evidence-based measures to regulate alcohol.
- Marketing often targets children and youth and often depicts women in de-humanized, sexualized ways.
- Self-regulatory schemes are systematically violated by the alcohol industry.

The leading multinational corporations of the beer, wine and liquor industries are significant vectors of an industrial epidemic that threatens sustainable development.
SDG 17.16: Enhance the global partnership for sustainable development, complemented by multi-stakeholder partnerships that mobilize and share knowledge, expertise, technology and financial resources, to support the achievement of the sustainable development goals in all countries, in particular developing countries.

SDG 17.17: Encourage and promote effective public, public-private and civil society partnerships, building on the experience and resourcing strategies of partnerships.

Big Alcohol & SDGs: Conflict of interest

The producers of alcohol and other unhealthy commodities are commercial determinants of ill-health, economic harm and under-development. Alcohol is a major obstacle to achieving the SDGs. To effectively curb the commercial drivers of this obstacle to development, alcohol availability, affordability, and marketing (3 Best Buys) need to be regulated.

But this goes contrary to the core business interest of Big Alcohol: to maximize profits by increasing alcohol consumption everywhere.
